	COMMENT	JOURNAL	TITLE	REFERENCE	AUTHORS TITLE
sequencing record contains 244 individual contigs. Runs of N are used to separate the reads and the order in which they appear is completely intitizing. Low-pass sequence sampling is useful for intitizing longs that may be generich and allows located relationes beauting of 889 bp in length be reserved.  870 1188: contig of 889 bp in length gen of unknown length 1182 2002: contig of 1021 bp in length gen of unknown length 2561 3646: contig of 759 bp in length gen of unknown length 4521 4813 can of 1021 bp in length gen of unknown length 4521 4813 contig of 686 bp in length gen of unknown length 4521 4813 contig of 687 bp in length gen of unknown length 6601 6992: contig of 874 bp in length 6601 6992: contig of 875 bp in length 6601 6992: contig of 680 bp in length 6601 6992: contig of 681 bp in length 6601 6992: contig of 681 bp in length 6601 6992: contig of 682 bp in length 6602 contig of 683 bp in length 6603 end of unknown length 6603 end of unknown length 6604 end of unknown length 6605 end of unknown length 6606 end of unknown length 6607 end of unknown length 6608 end of unknown length 6609 end of unknown length 6600 end of unknown length 6600 end of unknown length 6600 end of unknown length 6601 end of unknown length 6602 end of unknown length 6603 end of unknown length 6603 end of unknown length 6604 end of unknown length 6605 end of unknown length 6606 end of unknown length 6607 end of unknown length 6608 end of unknown length 6609 end of unknown le	2800 Mitchell Drive, Walnut Creek, CA is sequence version replaced gi:668643	ted (10-J) Institut	nstitute.	unpublished  ( bases 1 to 265383)  The Taint Group Institute	DOE Joint Genome Institute.               * NOTE: This record contains 175 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

```

* sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced.  * overlap relationships among clones to be deduced.  * will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.  * 1014 1615: contig of 1013 bp in length app of unknown length app of unk	158 elleValmetIleGlyTyrAlaThrLeuAlaGlnArgIleAlaLeuTrpI 175  1835 GATCGTCAGCCGGCTACACCGGGCTGCCGCGCGTACCGCGTAC 4786  175 LeLyGGlyProLyGGlnMetLysAlaLeuAsnLysIlePheGlySerLeu 191  175 1cLyGGlyProLyGGlnMetLysAlaLeuAsnLysIlePheGlySerLeu 191  176 177 1cLyGGlyProLyGGlnMetLysAlaLeuAsnLysIlePheGlySerLeu 191  177 177 177 177 177 177 177 177 177 1

                                                                                                                                                                                                                                              This is the DNA sequence the novel rhtB gene of Escherichia coli (2 K-12. The rhtB gene maps at 86 min on the E. coli chromosome. The gene participates in resistance to homoserine. Amplification of the gene results in an improvement of the amino acid productivity of E. coli. The invention provides: the AntB protein (see Y79298); DNA encoding the RhtB, especially nucleotides 557-1171 of the present sequence; a bacterium, especially of the genus Escherichia, in which L-homoserine resistance is enhanced by amplifying the copy number or increasing the expression rate of the rhtB DNA, the DNA being carried on a multicopy vector or on a transposon; and a method for producing an amino acid by cultivating the bacterium in a culture medium to produce and accumulate the amino acid in the medium, from which it is recovered. The method is used for the production of L-homoserine, L-alanine, L-isoleucine, L-valine or
                                                                                                                                                                Sequence 1200

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the L-homoserine resistance gene, rhtB, from Escherichia coli. This sequence may be used to impart L-homoserine resistance on E. coli bacteria, which would be useful for producing a high yield of L-homoserine. L-homoserine resistance means that the bacteria will be able to grow on a minimal medium containing L-homoserine at a concentration at which the corresponding wild-type strain would not grow. Since the transformed bacteria can grow on the minimal medium, it can synthesise L-homoserine, which accumulates. The accumulated amino acids can then be removed from the culture medium. The bacterium of the present invention may also be used to synthesise L-threonine, L-valine and L-leucine at increased levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel Escherichia bacterium having enhanced L-threonine resistato enhanced RhtC protein activity, used to produce L-threonine, L-homoserine, L-valine and L-leucine -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is the yeas gene (an excretion protein gene) of Escherichia coli. The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the cell. In this case, an increase in lysine, alanine, histidine, isolaucine, glutamic acid and proline is achieved if multiple copies of the gene are transfected into a bacterium. The bacterium used is E. coli.

The MelA protein is active in catalysing production of melanin synthesis, as well as components of marine exopolysaccharides. The MelA protein can be used as a UV blocker in sunscreen, pigment and dye compositions useful in cosmetic applications, as tints for glass on in paints and coatings for plastics, synthetic resins and fabrics, rubl

C74446 to C77606 encode the proteins given in B40237 to B43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cholesterol ester storage; systemic lupus erythematosus; infection; severe combined immunodeficiency; malaria; autoimmune disorder; asthma; allergy; aplastic anaemia; nocturnal haemoglobinuria; burn; wound;

The CC sequences can be used for determining the presence of or predisposition CC to, or preventing or treating pathological conditions associated with an CC ORFX-associated disorder. The nucleic acids can be used to express ORFX CC proteins in gene therapy vectors. The proteins and nucleic acids may be CC used to treat cancers, proliferative disorders, neurodegenerative CC disorders, osteoarthritis, graft vs host disease, cardiovascular disease, CC diabetes mellitus, hypertension, hypothyroidism, cholesterol ester CC storage, systemic lupus erythematosus, severe combined immunodeficiency CC (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune CC disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and CC cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to cenhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ratio:

                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the yahN gene (an excretion protein gene) of Escherichia coli. The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the cell. In this case, an increase in lysine, glutamic acid and proline is achieved if multiple copies of the gene are transfected into a bacterium. The bacterium used is E. coli.

                                                                                                                                                                                                                The present sequence is the yfik gene (an excretion protein gene) of Escherichia coli. The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the cell. In this case, an increase in threonine, histidine, glutamic acid and proline is achieved if multiple copies of the gene are transfected into a bacterium. The bacterium used is E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprises increasing the expression amount of an L-amino acid protein \boldsymbol{\cdot}

                                                                                                                                                                                                                                                         CC Agrobacterium vitis hypersensitivity response (HR) elicitor proteins (C (B11630-B11688). The HR is a rapid, localised necrosis that is C (B11630-B11688). The HR is a rapid, localised necrosis that is C associated with the active defence of plants against many pathogens, and CC occurs when a pathogenic organism interacts with a nonhost plant (i.e. CC one in which intracellular bacterial growth and disease development do CC not occur). Like other HR elicitors, the A. vitis elicitor functions in cC in mailing-off and killing of the pathogen. On grape plants, the A. vitis clicitor functions of plants by causing a rapid hypersensitive response that results (C in mailing-off and killing of the pathogen. On grape plants, the A. vitis clicitor corrections in non-host plants by causing a rapid hypersensitive response that results (C in plant cells and induction of pathogen resistance. A. vitis HR elicitor croteins, in non-infectious form, are used to treat plants or their seeds (C inspart resistance to disease, such as those caused by fund; bacteria (C control insects, to impart resistance to environmental stresses, e.g., cc cold, and to improve nutritional value, e.g., altered oil content. The C control insects, to impart resistance to environmental stresses, e.g., cc cold, and to improve nutritional value, e.g., altered oil content. The C control of previously untreatable diseases, provide systemic treatment; and end for historical contents acents crocliving the may allow (C control of previously untreatable diseases, provide systemic treatment; and content the need for historical content.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hypersensitive response elicitor protein; HR; disease resistance; insecticide; fungicide; antiviral; bactericide; growth enhancer; stress resistance; transgenic plant; ds.

The HR is a rapid, localised necrosis that is CC associated with the active defence of plants against many pathogens, and CC occurs when a pathogenic organism interacts with a nonhost plant (i.e. CC one in which intracellular bacterial growth and disease development do CC not occur). Like other HR elicitors, the A. vitis elicitor functions in CC in walling-off and killing of the pathogen. On grape plants, the A. vitis clicitor induces a restricted necrosis of tissues, resulting in the death of plant cells and induction of pathogen resistance. A. vitis HR elicitor CC proteins, in non-infectious form, are used to treat plants or their seeds CC to impart resistance to disease, such as those caused by fungi, bacteria or viruses; and to enhance growth, e.g., to increase yield or to provide CC control insects, to impart resistance to environmental stresses, e.g., CC cold, and to improve nutritional value, e.g., altered oil content. The cs same effects can be produced by producing transgenic plants or seeds by incorporation of DNA that encodes A. vitis HR elicitor proteins. Use of CC control of previously untreatable diseases; provide systemic treatment; can and to improve nutrientable diseases; provide systemic treatment; can and to proteins or nucleic acids encoding them, may allow control of previously untreatable diseases; provide systemic treatment;
                                                                                                                                                                                                                                                             Align seg 1/1 to: A61502

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the L-threonine resistance gene, rhtC, from Escherichia coli. This sequence may be used to impart L-threonine resistance on E. coli bacteria, which would be useful for producing a high yield of L-threonine. L-threonine resistance means that the bacteria will be able to grow on a minimal medium containing L-threonine at a concentration at which the corresponding wild-type strain would not grow. Since the transformed bacteria can grow on the minimal medium, it can synthesise L-threonine, which accumulates. The accumulated amino acids can then be removed from the culture medium. The bacterium of the present invention may also be used to synthesise L-homoserine, L-valine and L-leucine at increased levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel Escherichia bacterium having enhanced L-threonine resistance due to enhanced RhtC protein activity, used to produce L-threonine, L-valine and L-leucine -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 20

                      The present sequence is the yggA gene (an excretion protein gene) of Escherichia coli. The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the cell. In this case, an increase in arginine, glutamic acid and lysine is achieved if multiple copies of the gene are transfected into a bacterium. The bacterium used is E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        798

LysG and LysE encode a lysine transport regulatory protein and an export protein, respectively. Microbial production of amino acids (A) is improved by increasing the export carrier activity and/or the export gene expression in a microorganism that produces (A). The method is specifically used to increase production of lysine, used as an animal feed additive. Other (A) are variously useful as pharmaceuticals, condiments and intermediates for fine chemicals. This method increases the amount of (A) secreted into the culture medium. Export of (A) has been found to depend on a single gene.

NB. This sequence has been created from the information given in table 2
                                                                                                                                                                                                                                                                                                                                                                          Sequence 2374 BP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diabetes, especially non-insulin-dependent diabetes (NIDDM). Also claimed are: (1) a method for evaluating an agent for use in treating diabetes by evaluating the effect of the agent on an aspect of HNF4 metabolism; (2) the agent identified in (1); (3) a method for treating a cell having an abhormality in structure or metabolism of HNF4, comprising administering the agent to the cell; (4) a method for producing a fragment or analogue of HNF4 polypeptide having wild-type activity; and (5) a method for producing an HNF4 polypeptide or fragment or analogue having a non-wild type activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               isoforms alpha 1 (see V27577), alpha 2 (see V27578) and gamma (see V27580). HNF4 is a transcription factor whose ligand has not yet been identified. The isoforms of HNF4 are reported to be derived from alternative splicing events. The alpha isoforms have been mapped to chromosome 20 and the gamma isoform to chromosome 8. A claimed method for determining if an animal is at tisk of developing diabetes, comprises evaluating an aspect of HNF4 metabolism or structure in the animal. especially as related to HNF4 from chromosome 20. An abnormality in the aspect of HNF4 metabolism or structure is diagnostic of being at risk for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated Enterococcus faecalis polynucleotides and polypeptides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus
